Lecture #27:

Distributed Transactions

R&G: Chapter 22

1

PARALLEL / DISTRIBUTED DBMSs

2

Why do we need parallel / distributed DBMSs?

- Increased performance (throughput and latency)

- Increased availability

Database is spread out across multiple resources to improve parallelism

Appears as a single database instance to the application

- SQL query on a single-node DBMS must generate same result on a parallel or dist. DBMS

- Due to principle of **data independence**

2

PARALLEL VS. DISTRIBUTED DBMSs

3

Parallel DBMSs

- Nodes are physically close to each other

- Nodes connected with high speed LAN

- Communication cost is assumed to be small

Distributed DBMSs

- Nodes can be far from each other

- Nodes connected using public network

- Communication cost and problems cannot be ignored

3

OBSERVATION

5

A **distributed** transaction can access data located on multiple nodes

- The DBMS must guarantee the ACID properties

We have not discussed how to ensure that all nodes agree to commit a transaction and then to make sure it does commit if we decide that it should

- What happens if a node fails?

- What happens if our messages show up late?

- What happens if we don't wait for every node to agree?

5

OUTLINE

Distributed Locking

Distributed Deadlock Detection

Distributed Two-Phase Commit (2PC)

Recovery and 2PC

6

DISTRIBUTED CONCURRENCY CONTROL

Consider a **shared-nothing** distributed DBMS

For today, **assume partitioning but no replication of data**

Each transaction arrives at some node:

The “coordinator” for the transaction

7

Lock Table Design: The typical design involves partitioning locks with the data. Each node independently manages its own lock table, which works well for objects that fit on a single node, like pages or tuples.
Coarser-Grained Locks: For larger objects that exist across nodes, such as tables or the entire database, a “home” node is assigned where the lock table for these objects is centralized.
Lock Partitioning: The document also mentions that these coarser-grained locks can either be partitioned across nodes or centralized at one node, depending on the design choice.

WHERE IS THE LOCK TABLE?

Typical design: Locks partitioned with the data

Independent: each node manages “its own” lock table

Works for objects that fit on one node (pages, tuples)

For coarser-grained locks, assign a “home” node

Object being locked (table, DB) exists across nodes

8

WHERE IS THE LOCK TABLE?, PART 2

Typical design: Locks partitioned with the data

Independent: each node manages “its own” lock table

Works for objects that fit on one node (pages, tuples)

For coarser-grained locks, assign a “home” node

Object being locked (table, DB) exists across nodes

These locks can be partitioned across nodes

9

WHERE IS THE LOCK TABLE?, PART 3

10

Typical design: Locks partitioned with the data

Independent: each node manages "its own" lock table

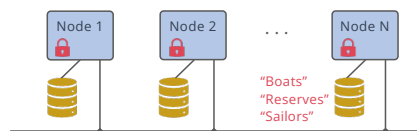

Works for objects that fit on one node (pages, tuples)

For coarser-grained locks, assign a "home" node

Object being locked (table, DB) exists across nodes

These locks can be partitioned across nodes

Or centralized at one node

10

IGNORE GLOBAL LOCKS FOR A MOMENT...

11

Every node does its own locking

Clean and efficient

"Global" issues remain:

Deadlock

Commit/Abort

11

OUTLINE

12

Distributed Locking

Distributed Deadlock Detection

Distributed Two-Phase Commit (2PC)

Recovery and 2PC

12

WHAT COULD GO WRONG? #1

13

Deadlock detection

No cycles in local waits-for graphs, but there's a cycle in global waits-for graph

13

WHAT COULD GO WRONG? #1, PART 2

14

Deadlock detection

Easy fix: periodically union at designated node. If a cycle is detected, abort one txn

14

OUTLINE

15

Distributed Locking

Distributed Deadlock Detection

Distributed Two-Phase Commit (2PC)

Recovery and 2PC

15

WHAT COULD GO WRONG? #2

16

Failures/Delays: Nodes

Commit? Abort?

When the node comes back, how does it recover in a world that moved forward?

16

WHAT COULD GO WRONG? #2, PART 2

17

Failures/Delays: Nodes

Failures/Delays: Messages

Non-deterministic reordering per channel, interleaving across channels

"Lost" (very delayed) messages

17

WHAT COULD GO WRONG? #2, PART 3

18

Failures/Delays: Nodes

Failures/Delays: Messages

Non-deterministic reordering per channel, interleaving across channels

"Lost" (very delayed) messages

18

WHAT COULD GO WRONG? #2, PART 4

19

Failures/Delays: Nodes

Failures/Delays: Messages

Non-deterministic reordering per channel, interleaving across channels

"Lost" (very delayed) messages

How do all nodes agree on Commit vs. Abort?

19

BASIC IDEA: DISTRIBUTED VOTING

20

Vote for commitment

How many votes does a commit need to win?

Any single node could observe a problem (e.g., deadlock, constraint violation)

Hence must be unanimous

20

DISTRIBUTED VOTING? HOW?

21

How do we implement distributed voting?!

In the face of message/node failure/delay?

21

2-PHASE COMMIT

22

A.k.a. 2PC. (Not to be confused with 2PL!)

Phase 1: Voting phase

Coordinator tells participants to "prepare"

Participants respond with yes/no votes

Unanimity required for yes!

Phase 2: Commit phase

Coordinator disseminates result of the vote

Need to do some logging for failure handling....

22

2-PHASE COMMIT, PART 1

23

Phase 1:

Coordinator tells participants to "prepare"

Participants respond with yes/no votes

Unanimity required for commit!

Phase 2:

Coordinator disseminates result of the vote

Participants respond with Ack

23

2-PHASE COMMIT, PART 2

24

Phase 1:

Coordinator tells participants to "prepare"

Participants respond with yes/no votes

Unanimity required for commit!

Phase 2:

Coordinator disseminates result of the vote

Participants respond with Ack

24

2-PHASE COMMIT, PART 3

25

Phase 1:

Coordinator tells participants to "prepare"

Participants respond with yes/no votes

Unanimity required for commit!

Phase 2:

Coordinator disseminates result of the vote

Participants respond with Ack

25

2-PHASE COMMIT, PART 4

26

Phase 1:

Coordinator tells participants to "prepare"

Participants respond with yes/no votes

Unanimity required for commit!

Phase 2:

Coordinator disseminates result of the vote

Participants respond with Ack

26

2-PHASE COMMIT, PART 5

27

Phase 1:

Coordinator tells participants to "prepare"

Participants respond with yes/no votes

Unanimity required for commit!

Phase 2:

Coordinator disseminates result of the vote

Participants respond with Ack

27

2-PHASE COMMIT, PART 6

28

Phase 1:

Coordinator tells participants to "prepare"

Participants respond with yes/no votes

Unanimity required for commit!

Phase 2:

Coordinator disseminates result of the vote

Participants respond with Ack

28

2-PHASE COMMIT, PART 7

29

Phase 1:

Coordinator tells participants to "prepare"

Participants respond with yes/no votes

Unanimity required for commit!

Phase 2:

Coordinator disseminates result of the vote

Participants respond with Ack

29

2-PHASE COMMIT, PART 8

30

Phase 1:

Coordinator tells participants to "prepare"
Participants respond with yes/no votes
Unanimity required for commit!

Phase 2:

Coordinator disseminates result of the vote
Participants respond with Ack

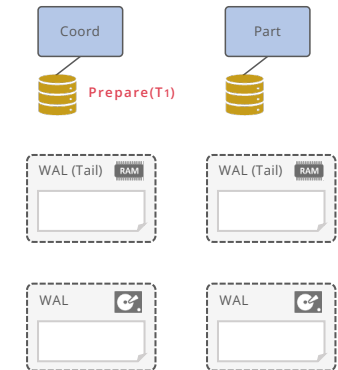

30

ONE MORE TIME, WITH LOGGING

31

Phase 1:

Coordinator tells participants to "prepare"
Participants generate prepare/abort record
Participants flush prepare/abort record
Participants respond with yes/no votes
Coordinator generates commit record
Coordinator flushes commit record

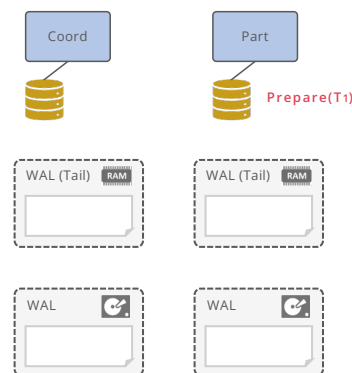

31

ONE MORE TIME, WITH LOGGING, PART 2

32

Phase 1:

Coordinator tells participants to "prepare"
Participants generate prepare/abort record
Participants flush prepare/abort record
Participants respond with yes/no votes
Coordinator generates commit record
Coordinator flushes commit record

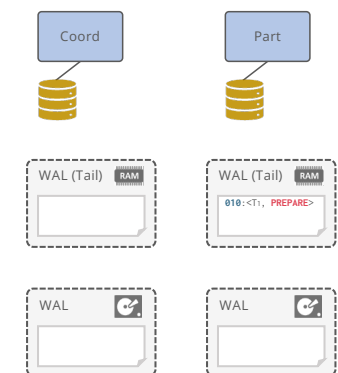

32

ONE MORE TIME, WITH LOGGING, PART 3

33

Phase 1:

Coordinator tells participants to "prepare"
Participants generate prepare/abort record
Participants flush prepare/abort record
Participants respond with yes/no votes
Coordinator generates commit record
Coordinator flushes commit record

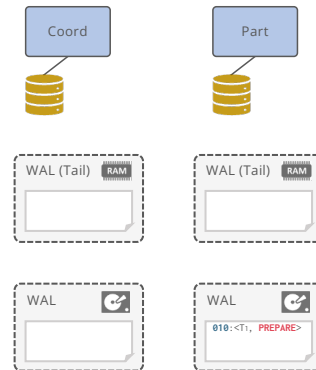

33

ONE MORE TIME, WITH LOGGING, PART 4

34

Phase 1:

- Coordinator tells participants to "prepare"
- Participants generate prepare/abort record
- Participants flush prepare/abort record**
- Participants respond with yes/no votes
- Coordinator generates commit record
- Coordinator flushes commit record

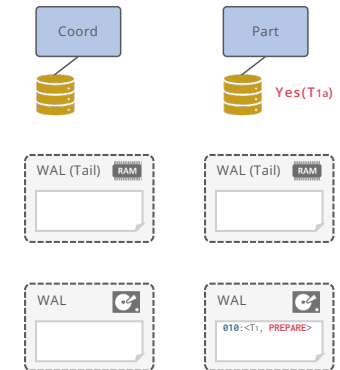

34

ONE MORE TIME, WITH LOGGING, PART 5

35

Phase 1:

- Coordinator tells participants to "prepare"
- Participants generate prepare/abort record
- Participants flush prepare/abort record
- Participants respond with yes/no votes**
- Coordinator generates commit record
- Coordinator flushes commit record

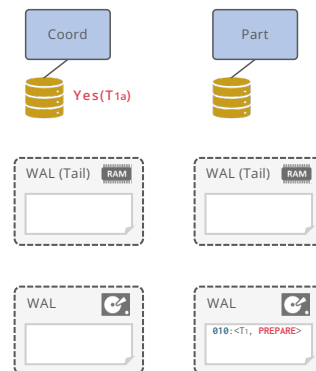

35

ONE MORE TIME, WITH LOGGING, PART 6

36

Phase 1:

- Coordinator tells participants to "prepare"
- Participants generate prepare/abort record
- Participants flush prepare/abort record
- Participants respond with yes/no votes**
- Coordinator generates commit record
- Coordinator flushes commit record

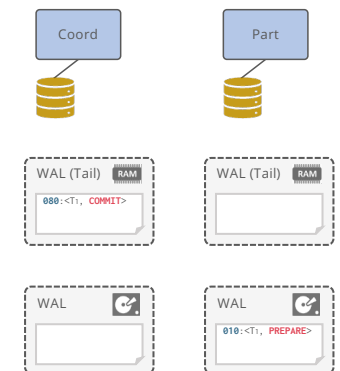

36

ONE MORE TIME, WITH LOGGING, PART 7

37

Phase 1:

- Coordinator tells participants to "prepare"
- Participants generate prepare/abort record
- Participants flush prepare/abort record
- Participants respond with yes/no votes
- Coordinator generates commit record**
- Coordinator flushes commit record

37

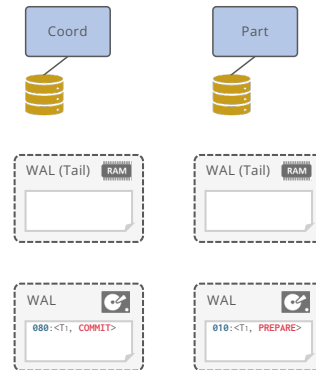

ONE MORE TIME, WITH LOGGING, PART 8

38

Phase 1:

- Coordinator tells participants to "prepare"
- Participants generate prepare/abort record
- Participants flush prepare/abort record
- Participants respond with yes/no votes
- Coordinator generates commit record

Coordinator flushes commit record

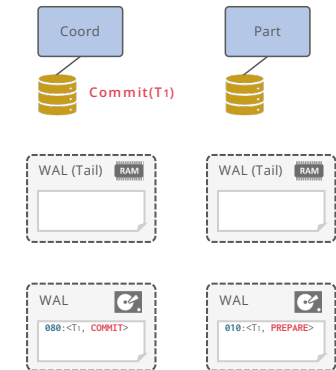

38

ONE MORE TIME, WITH LOGGING, PART 9

39

Phase 2:

- Coordinator broadcasts result of vote
- Participants make commit/abort record
- Participants flush commit/abort record
- Participants respond with Ack
- Coordinator generates end record
- Coordinator flushes end record

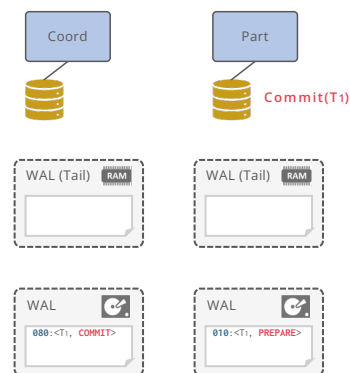

39

ONE MORE TIME, WITH LOGGING, PART 10

40

Phase 2:

- Coordinator broadcasts result of vote
- Participants make commit/abort record
- Participants flush commit/abort record
- Participants respond with Ack
- Coordinator generates end record
- Coordinator flushes end record

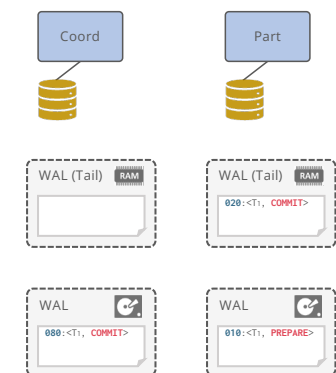

40

ONE MORE TIME, WITH LOGGING, PART 11

41

Phase 2:

- Coordinator broadcasts result of vote
- Participants make commit/abort record
- Participants flush commit/abort record
- Participants respond with Ack
- Coordinator generates end record
- Coordinator flushes end record

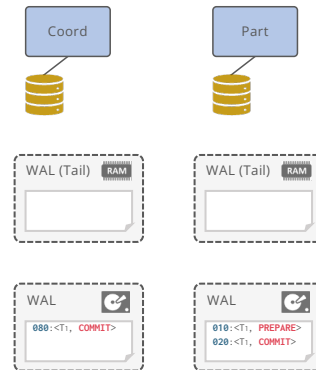

41

ONE MORE TIME, WITH LOGGING, PART 12

Phase 2:

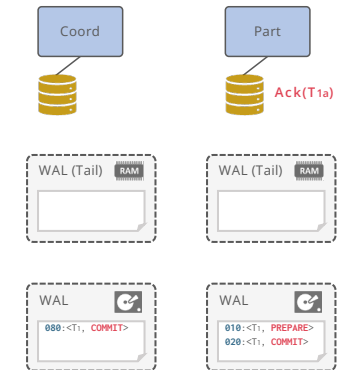

- Coordinator broadcasts result of vote
- Participants make commit/abort record
- Participants flush commit/abort record**
- Participants respond with Ack
- Coordinator generates end record
- Coordinator flushes end record

ONE MORE TIME, WITH LOGGING, PART 13

Phase 2:

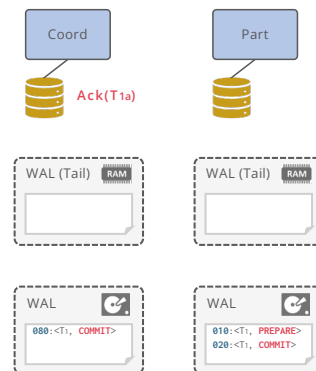

- Coordinator broadcasts result of vote
- Participants make commit/abort record
- Participants flush commit/abort record
- Participants respond with Ack**
- Coordinator generates end record
- Coordinator flushes end record

ONE MORE TIME, WITH LOGGING, PART 14

Phase 2:

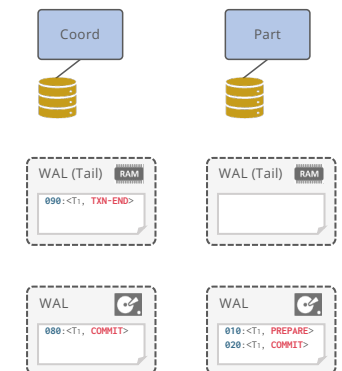

- Coordinator broadcasts result of vote
- Participants make commit/abort record
- Participants flush commit/abort record
- Participants respond with Ack**
- Coordinator generates end record
- Coordinator flushes end record

ONE MORE TIME, WITH LOGGING, PART 15

Phase 2:

- Coordinator broadcasts result of vote
- Participants make commit/abort record
- Participants flush commit/abort record
- Participants respond with Ack
- Coordinator generates end record**
- Coordinator flushes end record

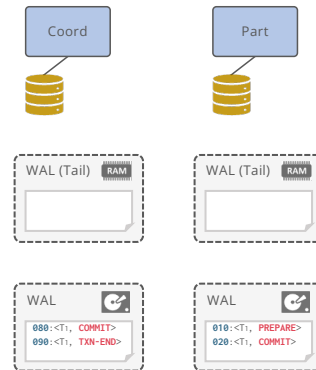

ONE MORE TIME, WITH LOGGING, PART 16

46

Phase 2:

- Coordinator broadcasts result of vote
- Participants make commit/abort record
- Participants flush commit/abort record
- Participants respond with Ack
- Coordinator generates end record

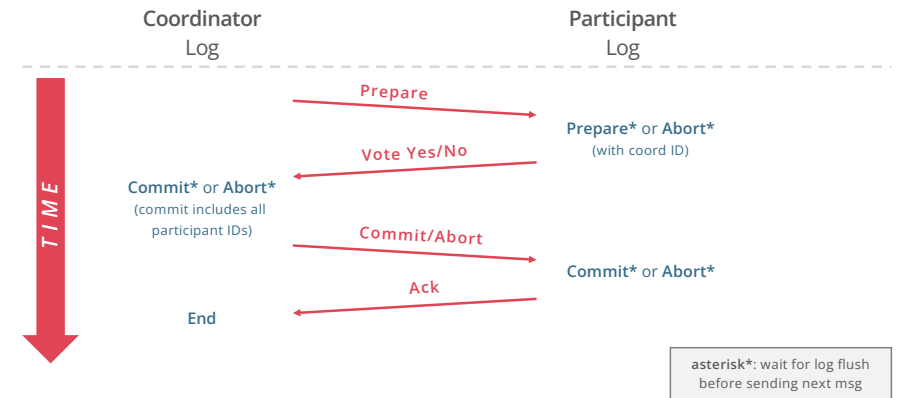

Coordinator flushes end record

46

2PC IN A NUTSHELL

47

47

OUTLINE

48

- Distributed Locking
- Distributed Deadlock Detection
- Distributed Two-Phase Commit (2PC)
- Recovery and 2PC

48

FAILURE HANDLING

49

Assume everybody recovers eventually **Eventual consistency**

Big assumption!

Depends on WAL (and short downtimes)

Coordinator notices a Participant is down?

- If participant hasn't voted yet, coordinator aborts transaction
- If waiting for a commit Ack, hand to "recovery process"

Participant notices Coordinator is down?

- If it hasn't yet logged prepare, then abort unilaterally
- If it has logged prepare, hand to "recovery process"

Note

Thinking a node is "down" may be incorrect!

49

INTEGRATION WITH ARIES RECOVERY

50

On recovery

Assume there's a "Recovery Process" at each node

It will be given tasks to do by the Analysis phase of ARIES

These tasks can run in the background (asynchronously)

Note: multiple roles on a single node

Coordinator for some transactions, Participant for others

50

HOW DOES RECOVERY PROCESS WORK?

53

Coordinator recovery process gets inquiry from a "prepared" participant

If transaction table at coordinator says aborting/committing

Send appropriate response and continue protocol on both sides

If transaction table at coordinator says nothing: **send ABORT**

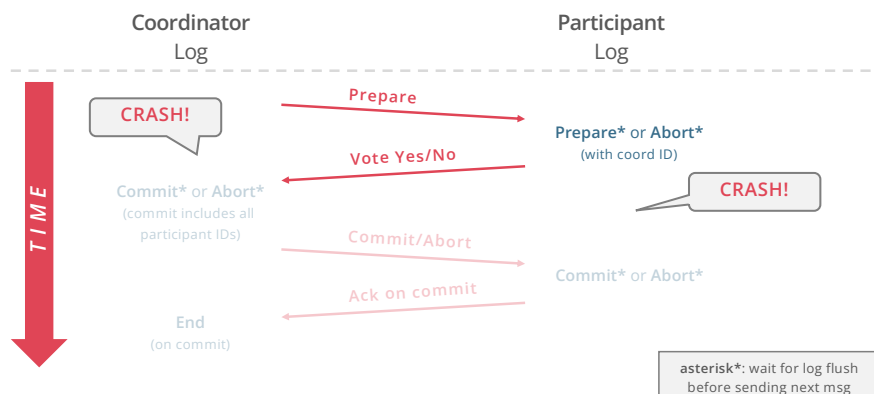

Only happens if coordinator had also crashed before writing commit/abort

Inquirer does the abort on its end

53

2PC IN A NUTSHELL

54

54

RECOVERY: THINK IT THROUGH

55

What happens when coordinator recovers?

With "commit" and "end"?

With just "commit"?

With "abort"?

Commit iff coordinator logged a commit

What happens when participant recovers:

With no prepare/commit/abort?

With "prepare" and "commit"?

With just "prepare"?

With "abort"?

55

RECOVERY: THINK IT THROUGH

What happens when coordinator recovers?

With “commit” and “end”? **Nothing**

With just “commit”? **Rerun Phase 2!**

With “abort”? **Nothing (presumed abort)**

Commit iff coordinator
logged a commit

What happens when participant recovers:

With no prepare/commit/abort? Nothing (presumed abort)

With “prepare” and “commit”? **Send Ack to coordinator**

With just “prepare”? **Send inquiry to coordinator**

With “abort”? **Nothing (presumed abort)**

56

2PC + STRICT 2PL

Ensure point-to-point messages are densely ordered

1,2,3,4,5...

Dense per (sender/receiver/transaction ID)

Receiver can detect anything missing or out-of-order

Receiver buffers message k+1 until [1..k] received

Effect: receiver considers messages in order

Commit:

When a participant processes Commit request, it has all the locks it needs Since the coordinator has approval from all participants

Flush log records and drop locks atomically

Abort:

Its safe to abort autonomously, locally: no cascade

Log appropriately to 2PC (presumed abort in our case)

Perform local Undo, drop locks atomically

57

AVAILABILITY CONCERNS

What happens while a node is down?

Other nodes may be in limbo, holding locks

So certain data is unavailable

This may be bad...

Dead Participants? Respawned by coordinator

Recover from log

And if the old participant comes back from the dead, just ignore it and tell it to recycle itself

Dead Coordinator?

This is a problem!

3-Phase Commit was an early attempt to solve it

Paxos Commit provides a more comprehensive solution

Gray + Lamport paper. Out of scope for this course

Elect new coordinator if the coordinator is down

58

SUMMARY

Data partitioning provides scale-up

Can also partition lock tables and logs

But need to do some global coordination:

Deadlock detection: easy

Commit: trickier

Two-phase commit is a classic distributed consensus protocol

Logging/recovery aspects unique:

Many distributed protocols gloss over

But 2PC is unavailable on any single failure

This is bad news for scale-up, because odds of failure go up with #machines

Paxos Commit addresses that problem

59
